## Introduction

Jefferson County is updating the Shoreline Master Program (SMP) to comply with the Washington State Shoreline Management Act (SMA or the Act) requirements (RCW 90.58), and the state's shoreline Guidelines (Washington Administrative Code [WAC] 173-26), which were adopted in 2003.

This Consistency Report documents the level of consistency between the state guidelines and the Draft SMP developed, but not adopted by the County in 2000. It also describes the consistency between the County's preliminary shoreline inventory and analysis report<sup>1</sup> and state requirements for the amendment of shoreline master programs (WAC 173-26, Part III). The report outlines specific areas that need to be redrafted and/or reconsidered in light of the 2003 Guidelines. The Consistency Report will be used in conjunction with the Integration Strategy (prepared under separate cover) to guide the development of the updated SMP.

## Consistency of the 2000 Draft SMP

In July 2000, Jefferson County completed the *Draft Jefferson County Shoreline Master Program* (SMP) as an update to its previously adopted SMP. While the 2000 draft SMP provided a comprehensive package of recommended changes to goals, policies, regulations and administration, formal adoption by the County was delayed in anticipation of the revisions to the shoreline guidelines contained in WAC 173-26.

Under a grant from Ecology, Jefferson County has now embarked on the development of a revised SMP to comply with the requirements of WAC 173-26. The 2000 draft SMP will be the foundation for this revision process, and this memorandum provides a consistency review, comparing Jefferson County's 2000 draft SMP with Chapter 173-26 WAC, the Shoreline Master Program Guidelines.

The Shoreline Management Act (RCW 90.58) and the Guidelines comprise standards and criteria to be used by Ecology in reviewing the adoption and amendment of local master programs under RCW 90.58.090. According to WAC 173-26-171, the Guidelines have three specific purposes. First, they assist local governments in developing master programs, and second, along with the policy of RCW 90.58.020, serve as criteria for state review of local master programs under RCW 90.58.090. Finally, the Guidelines contain parameters, standards and review criteria for local master programs, allowing local governments substantial discretion to adopt master programs that reflect local

<sup>1</sup> *Jefferson County Shoreline Master Program Update: Shoreline Inventory and Analysis Report* prepared by Neil Harrington of the Jefferson County Department of Community Development and last revised October 25, 2005.

circumstances and other regulatory and non-regulatory programs related to the goals of shoreline management.

Adolfson planners reviewed the Jefferson County's 2000 draft SMP to evaluate the level of consistency of the SMP with the Guidelines. This review specifically compared individual components of the Guidelines and the SMP including master program elements, environment designations, general provisions, shoreline modifications, and shoreline uses. Some of the key issues emerging from this review are summarized below, while more detailed findings are summarized in Table 1.

Overall, the 2000 draft SMP provides a good foundation from which to develop a revised Program. Many of the regulations for modifications and specific uses, for example, are fairly complete, and many other existing components such as exemptions, elements and environment designations are largely in alignment with the Guidelines.

### **Master Program Elements**

WAC 173-26-191(b) states that master programs shall, where appropriate, incorporate various 'elements' into the program. These elements, derived from the Shoreline Management Act (90.58.100(2) RCW), address economic development; public access; recreation; circulation; shoreline use; conservation; and historic, scientific and educational resources.

Jefferson County's existing 2000 draft SMP is largely consistent with this provision of the Guidelines, as it contains all of the elements specified by the Guidelines in its Chapter 3, Master Program Elements: Goals and Policies. While not explicitly specified in the Guidelines, there are opportunities to add a 'restoration' element to help support policies, regulations and programs addressing restoration throughout the revised SMP.

Similarly, the Guidelines suggest that local jurisdictions consider adding a flood hazard reduction element. Comprehensive flood hazard reduction has been identified in this review as an opportunity for improvement in the 2000 draft SMP, and adding such an element could help provide a framework for adding new policy language and regulations.

### **No Net Loss of Ecological Functions**

WAC 173-26-201(c) notes that the Guidelines are designed to assure, at a minimum, "no net loss" of ecological functions necessary to sustain shoreline natural resources and to plan for restoration of ecological functions where they have been impaired. Master programs shall contain policies and regulations to meet these "no net loss" goals through its environment designation system, policies and regulations for shoreline uses and modifications, critical area policies and regulations, and mitigation measures.

The existing 2000 draft SMP contains various references to avoiding adverse impacts to ecological functions, fish and wildlife habitat, and other resources, but there are substantial opportunities to incorporate the principle of no net loss of ecological functions throughout the document, in both policies and regulations.

### **Environment Designations**

WAC 173-26-211 contains basic requirements for classifying environment designations in local shoreline master programs. Environment designation classification systems are to be based on existing use patterns, the biological and physical character of the shoreline, and the goals and aspirations of the local jurisdiction. The Guidelines recommend a system composed of six basic environments: High Intensity, Shoreline Residential, Urban Conservancy, Rural Conservancy, Natural and Aquatic. The Guidelines indicate that local governments should assign environment designations consistent with the corresponding designation criteria for each environment, and that they should assure the protection of ecological functions be consistent with policies for restoration of degraded shorelines. Alternate designation systems are permitted as long as they are consistent with the purposes and policies of the Guidelines. Parallel environments may also be used.

The 2000 draft SMP contains seven shoreline environment designations, several of which closely align with the Guidelines in purpose and designation criteria. For example, the SMP contains both Natural and Aquatic shoreline environments, as well as a Rural Conservancy designation that closely parallels the criteria in the Guidelines. The Urban Residential designation also closely resembles the criteria for the Shoreline Residential environment in the Guidelines.

The 2000 draft SMP contains a Public Conservancy designation intended for shorelines in public ownership. While this is not a specific environment designation included in the Guidelines, this designation appears to be consistent with the Guidelines. The County may also consider adding a comparable Urban Conservancy environment designation to the SMP to address shorelines in more urban areas of the County where significant ecological functions still persist.

Finally, the Guidelines contain a High Intensity environment designation, while the 2000 draft SMP contains two “high intensity” designations, Urban High Intensity and Rural Intensive. Both of the SMP designations appear to be consistent with the purpose and designation criteria for High Intensity in the Guidelines. Specifically, the Guidelines call for assigning this designation to urban growth areas and “rural areas of more intense development” if they currently support or are suitable and planned for high-intensity water-oriented uses.

### **Flood Hazard Reduction and Channel Migration Zones**

WAC 173-26-221(3) contains provisions for developing policies and regulations to reduce flood damage or hazard, and for addressing uses, development, and shoreline

modifications that may increase flood hazards. Applicable shoreline master programs should include provisions to limit development and modifications that would interfere with the natural process of channel migration that may cause significant impacts to property or public improvements and result in a net loss of ecological functions. The Guidelines call for giving preference to non-structural over structural flood hazard reduction measures, for basing flood hazard reduction provisions on applicable comprehensive watershed and flood hazard management plans, and for integrating regulations with other flood hazard management regulations. Restoration is also encouraged.

The 2000 draft SMP provisions for flood hazard management are contained in policies and regulations for “flood hazard management projects” in Chapters 6 and 9. There appear to be substantial opportunities to augment the SMP with a broader strategy to address uses and development in both channel migration zones and flood hazard areas. This strategy would also include greater integration with comprehensive flood hazard management plans and programs.

### **Critical Areas**

Protection of the ecological functions of critical areas is a key component of the Guidelines. In accordance with WAC 173-26-221(2), shoreline master programs must manage critical areas located in the shoreline jurisdiction with policies and regulations that provide a level of protection that is at least equal to that provided by the local government’s critical area regulations adopted under the Growth Management Act.

There are significant opportunities to update the 2000 draft SMP with respect to critical areas. While the SMP contains policies for wetlands, fish and wildlife habitat areas, geologic hazard areas, and critical saltwater habitats, specific regulations are absent for many of these elements. Specifically, the Program does not include specific regulations for wetlands, geologic hazard areas, aquifer recharge areas, or frequently flooded areas. The SMP does include regulations for critical saltwater habitats, and what appear to be regulations that address some elements for critical freshwater habitats.

In the 2000 SMP’s critical area policies and regulations, there are also opportunities to expand on the protection and restoration of ecological functions as well as to improve links to ecosystem-wide processes. Policies and regulations could also be supported by references to a “full spectrum” of planning measures to protect critical areas, including regulatory and non-regulatory approaches. To ensure equivalent levels of protection with the County’s critical area regulations outside of the shoreline, the SMP could simply include those regulations by reference, or develop new regulations more closely tailored to conditions in the shoreline jurisdiction.

## **Incentives/Restoration**

WAC 173-26-201(f) specifies that master programs shall include goals, policies and actions for restoration of impaired shoreline ecological functions. Provisions should be designed to achieve overall improvements in ecological functions over time.

While a substantial portion of restoration planning will occur in the restoration plan prepared for the update of the County's SMP, there are opportunities to support such restoration planning through policy and regulatory language. Specifically, policies could be added to the SMP, either in a new restoration element or elsewhere, to encourage restoration through a combination of mitigation strategies, incentives, permit streamlining and non-regulatory approaches. Provisions could also be added to specific use regulations to encourage restoration using a combination of these approaches.

## **Other Issues**

Other opportunities for building on the existing 2000 Master Program include the following:

- Developing more integration between public access provisions in the SMP and County's plans for parks and trails.
- More specifically addressing vegetation conservation, including more explicit policies for vegetation conservation, specific vegetation conservation setback requirements, and vegetation conservation provisions in use regulations.

**Table 1 Consistency Review of the 2000 Draft Jefferson County SMP**

WAC Element	WAC Guidelines	Existing SMP
<p>173-26-211 (4) and (5): Environment Designation System</p>	<ol style="list-style-type: none"> <li>1. For each environment designation, state purpose, classification criteria, and management policies.</li> <li>2. Regulations shall address permitted, prohibited, and conditional uses; height and bulk limits; setbacks; density and frontage; and site development standards.</li> <li>3. Six recommended environments: High Intensity, Shoreline Residential, Urban Conservancy, Rural Conservancy, Natural, and Aquatic.</li> </ol>	<ol style="list-style-type: none"> <li>1. Chapter 5 of the existing draft SMP is generally consistent in format and content.</li> <li>2. Chapter 5 includes a slightly different system of environment designations than WAC 173-26-211(4)(c), which is consistent as long as designations meet the requirements of the guidelines.</li> <li>3. The existing draft SMP provides uses and activity regulations for each shoreline environment in Table 8.020.</li> <li>4. The existing draft SMP has seven environments instead of six. These include: Aquatic, Natural, Public, Rural Conservancy, Rural Intensive, Urban Residential, and Urban High-Intensity.</li> <li>5. The existing plan’s “Public Conservancy” environment closely resembles the “Urban Conservancy” as described in WAC 173-26-211(5)(e), but does not address private open space, floodplains, and other sensitive lands. There are opportunities to add an “Urban Conservancy” environment designation to the SMP for shorelines in urban growth areas that have sensitive resources or significant ecological functions intact.</li> <li>6. The existing draft SMP’s urban residential shoreline designation appears to align with the shoreline residential designation in the guidelines.</li> <li>7. The existing SMP has a “Rural Intensive” environment, which is not described in the guidelines, but appears to meet the intent of the high intensity environment designation.</li> <li>8. The guidelines include restoration of degraded shoreline as a purpose for the Aquatic, Natural, Urban/Public Conservancy Environments, and Rural Conservancy environments. The existing SMP does not specifically mention restoration in purpose statements for each environment designation.</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
173-26-221 (1): Archaeological and Historic Resources	<ol style="list-style-type: none"> <li>1. Include policies and regulations to protect historic, archaeological, and cultural features and qualities.</li> <li>2. Require stop work and notification of OAHP and tribes for resources uncovered during excavation.</li> <li>3. Require site inspection or evaluation by a professional archaeologist for sites with documented archaeological resources.</li> </ol>	<ol style="list-style-type: none"> <li>1. Sections 3.080 and 8.040 of the existing draft SMP contain goals, policies and regulations that are generally consistent with WAC 173-26-221.</li> </ol>
173-26-221(2): Critical Areas, Generally	<ol style="list-style-type: none"> <li>1. SMPs must provide for management of critical areas designated by GMA in the shoreline jurisdiction. Provide equivalent level of protection to critical area regulations adopted pursuant to GMA.</li> <li>2. Protect ecological functions and ecosystem-wide processes.</li> <li>3. Establishes that the planning objective for critical areas should be “the protection of existing ecological functions and ecosystem-wide processes and restoration of degraded ecological functions and ecosystem-wide processes.”</li> </ol>	<ol style="list-style-type: none"> <li>1. The existing draft SMP policies do not specify objectives for protection and restoration of ecological functions and ecosystem-wide processes.</li> <li>2. The existing draft SMP does not require that in addressing issues related to critical areas management in the shoreline that scientific and technical information must be used per guidelines.</li> <li>3. The existing draft SMP does not explicitly specify using “the full spectrum of planning and regulatory measures” in protecting and restoring critical areas, including the Comprehensive Plan; inter-local watershed plans; local development regulations; and state, tribal, and federal programs.</li> <li>4. The draft SMP does not provide policies for the protection of critical fresh water habitats.</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
173-26-221(2)(c)(i): Wetlands	<ol style="list-style-type: none"> <li>1. Regulations shall achieve, at a minimum, no net loss of wetland area and functions, including temporal losses when the wetland does not perform an intended function.</li> <li>2. Wetlands shall be categorized based on the rarity, irreplaceability, or sensitivity to disturbance and the functions the wetland provides.</li> <li>3. Master program provisions addressing alterations to wetlands shall be consistent with the policy of no net loss of wetland area and functions, wetland rating, scientific and technical information, and the mitigation sequence defined in WAC 173-26-201(2)(e).</li> <li>4. Master programs shall contain requirements for buffer zones around wetlands. Buffer requirements shall be adequate to ensure that wetland functions are protected and maintained in the long-term.</li> <li>5. Master programs shall contain wetland mitigation requirements that are consistent with WAC 173-26-201(2)(e) and which are based on a wetland's rating.</li> </ol>	<ol style="list-style-type: none"> <li>1. Wetlands are addressed in the existing draft SMP in Chapter 4 (4.040) and Chapter 8 (8.060).</li> <li>2. Wetland policies in the existing SMP are generally consistent with the guidelines, but the draft SMP does not contain wetland regulations.</li> <li>3. The existing SMP does not establish a wetland rating system based on rarity, irreplaceability, or wetland functions.</li> <li>4. Buffers and mitigation requirements are not specified in the draft SMP.</li> </ol>
173-26-221(2)(c)(ii): Geological Hazardous Areas	<ol style="list-style-type: none"> <li>1. Development in designated geologically hazardous areas shall be regulated in accordance with the following:               <ol style="list-style-type: none"> <li>i. Consult minimum guidelines for geologically hazardous areas, WAC 365-190-080(4).</li> <li>ii. Do not allow new development or the creation of new lots that would cause foreseeable risk from geological conditions to people or improvements during the life of the development.</li> <li>iii. Do not allow new development that would require structural shoreline stabilization over the life of the development.</li> <li>iv. Exceptions may be made for the limited instances where stabilization is necessary to protect allowed uses, where no alternative locations are available and no net loss of ecological functions will result.</li> </ol> </li> </ol>	<ol style="list-style-type: none"> <li>1. The existing SMP provides policies for Geological Hazardous Areas in Chapter 4 (4.040), but does not provide regulations of activities or uses in them.</li> <li>2. Policies are generally consistent with the guidelines, with the exception that the guidelines allow some shoreline stabilization in geologically hazardous areas, where certain circumstances apply and a geotechnical report is prepared. The draft SMP does not include any regulations for geologically hazardous areas, although some specific use standards address setbacks from bluffs and other related issues.</li> </ol>
173-26-221(2)(c)(iii): Critical Saltwater Habitat	<ol style="list-style-type: none"> <li>1. Critical saltwater habitats include kelp beds; eelgrass beds; spawning and holding areas for forage fish, such as herring, smelt and sandlance; subsistence, commercial and</li> </ol>	<ol style="list-style-type: none"> <li>1. Critical saltwater habitat policies are provided in Chapter 4 (4.040) of the existing draft SMP; regulations are provided in Chapter 8(8.060).</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
	<p>recreational shellfish beds; mudflats; intertidal habitats with vascular plants; and areas with which priority species have a primary association.</p> <p>2. Management planning should address the following, where applicable:</p> <ul style="list-style-type: none"> <li>i. Protecting a system of fish and wildlife habitats with connections between larger habitat blocks and open spaces, and restoring such habitats and connections where they are degraded;</li> <li>ii. Protecting existing and restoring degraded riparian and estuarine ecosystems, especially salt marsh habitats;</li> <li>iii. Establishing adequate buffer zones around areas to separate incompatible uses from the habitat areas;</li> <li>iv. Protecting existing and restoring degraded nearshore habitat; degraded or lost salmonid habitat; and degraded upland ecological functions important to critical saltwater habitats, including riparian vegetation;</li> <li>v. Improving water quality;</li> <li>vi. Protecting existing and restoring degraded sediment inflow and transport regimens; and</li> <li>vii. Correcting activities that cause excessive sediment input where human activity has led to mass wasting.</li> </ul> <p>3. Establish several specific standards regarding docks, bulkheads, bridges, fill, floats, jetties, utility, crossings, and other structures that potentially intrude over critical salt water habitat;</p> <p>4. In conjunction with state resource agencies and affected Indian tribes, governments should classify critical saltwater habitats and protect and restore seasonal ranges and habitat elements with which federal-listed and state-listed endangered, threatened, and priority species have a primary association and which, if altered, may reduce the likelihood that a species will maintain its population and reproduce</p>	<ul style="list-style-type: none"> <li>2. The existing draft SMP does not include mudflats, intertidal habitats with vascular plants, and areas with which priority species have a primary association as critical saltwater habitats.</li> <li>3. The existing draft SMP does not address resource management planning for several recommended items (protecting connections between habitat blocks, protecting and restoring salt marsh habitats, etc.)</li> <li>4. The existing draft SMP does not establish policies or regulations that “protect and restore seasonal ranges and habitat elements with which federal-listed and state-listed endangered, threatened, and priority species have a primary association.</li> <li>5. The existing draft SMP does not identify habitats or species of local importance.</li> <li>6. The SMP does not have an explicit policy addressing docks, bulkheads, and other structures within critical saltwater habitat.</li> <li>7. The existing draft SMP does not establish specific buffer zones around critical saltwater habitats, although Table 8.020 provides setbacks by environment designation and for specific uses.</li> </ul>

WAC Element	WAC Guidelines	Existing SMP
	<p>over the long term;</p> <ol style="list-style-type: none"> <li>5. Governments, in conjunction with state resource agencies and affected Indian tribes, should determine which habitats and species are of local importance;</li> <li>6. Comprehensive saltwater habitat management planning should identify methods for monitoring conditions and adapting management practices to new information.</li> </ol>	
<p>173-26-221(2)(c)(iv): Critical Freshwater Habitat</p>	<ol style="list-style-type: none"> <li>1. Critical freshwater habitats include portions of streams, rivers, wetlands, and lakes, their associated channel migration zones, and flood plains designated as such.</li> <li>2. Applicable master programs shall contain provisions to protect hydrologic connections between water bodies, watercourses, and associated wetlands.</li> <li>3. Restoration planning should include incentives and other means to restore water connections that have been impeded by previous development.</li> <li>4. Master program provisions for river and stream corridors should, where appropriate, be based on the information from comprehensive watershed management planning where available.</li> <li>5. Master programs shall provide for the protection of ecological functions associated with critical freshwater habitat as necessary to assure no net loss.</li> <li>6. Where appropriate, master programs shall integrate protection of critical freshwater habitat, protection with flood hazard reduction and other river and stream management provisions.</li> <li>7. Master programs shall include provisions that facilitate authorization of appropriate restoration projects.</li> </ol>	<ol style="list-style-type: none"> <li>1. The existing SMP provides policies for fish and wildlife habitat (including salmonid habitats) in Chapter 4 (4.040), but does not have explicit policies for critical freshwater habitats.</li> <li>2. The existing SMP's critical freshwater habitat regulations in Section 8.060 appear to apply only to areas "with which priority species have a primary association."</li> <li>3. The guidelines require that critical fresh water habitat regulations address stream channels, associated channel migration zones, wetlands, and flood plains, to the extent such areas are in the shoreline jurisdictional area. Channel migration zones are not explicitly addressed in the draft SMP.</li> <li>4. While the draft SMP does include provisions for restoration projects, there are opportunities to include more explicit recognition of other incentive programs that may be used to protect critical freshwater habitats.</li> </ol>
<p>173-26-221(3): Flood Hazard Reduction</p>	<ol style="list-style-type: none"> <li>8. Development in floodplains should not significantly or cumulatively increase flood hazard or be inconsistent with a comprehensive flood hazard management plan</li> <li>9. New development, including subdivisions, should not be established where the need for structural flood hazard measures in floodway or channel migration zone (CMZ) is reasonably foreseeable.</li> </ol>	<ol style="list-style-type: none"> <li>1. The existing draft SMP does not have specific sections for goals, policies, and development regulations addressing flood hazard reduction, although activities in floodplains and other flood prone areas are addressed under sections on flood hazard management projects.</li> <li>2. The existing draft SMP does not explicitly address CMZs.</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
	<ol style="list-style-type: none"> <li>10. Potentially appropriate uses in the CMZ or floodway include restoration activities, forest practices, existing and ongoing agriculture not further restricting channel movement, mining, bridges, utilities and transportation projects with no feasible alternative, repair and maintenance of existing legal uses, modifications and additions to existing non-agricultural legal uses that do not further limit channel migration; development in UGAs with existing structures to prevent channel movement and flooding; and measures to reduce shoreline erosion that does not interfere with natural processes.</li> <li>11. Allow new flood hazard reduction measures in the shoreline only when demonstrated as necessary to protect existing development, that non-structural measures are not feasible, vegetation can be conserved, and ecological functions mitigated to achieve no net loss.</li> <li>12. Place new measures landward of associated wetlands and vegetation conservation areas unless the measures are intended to increase ecological functions (e.g. wetland restoration).</li> <li>13. Require new measures to incorporate public access where there are no unavoidable safety, security, or environmental impacts and costs are not disproportionate.</li> <li>14. Require biological/geomorphologic study for gravel removal. Extraction should have long-term benefit for flood hazard reduction, should not result in loss of ecological function, and should be part of comprehensive flood hazard management solution.</li> </ol>	<ol style="list-style-type: none"> <li>3. Flood hazard reduction measures are consistently addressed as Flood Hazard Management Projects in Chapters 6 and 9 (6.060 and 9.030) of the existing draft SMP.</li> <li>4. The existing draft SMP does not address the integration of SMP flood management actions with applicable watershed management plans, comprehensive flood hazard management plans, and other comprehensive planning efforts.</li> <li>5. Gravel removal is addressed under policies and regulations for mining. Mining is prohibited in floodways but flood hazard reduction is not specifically addressed.</li> <li>6. Public access must be considered for all shoreline permits but is not specifically addressed for flood hazard reduction projects.</li> </ol>
173-26-221(4): Public Access	<ol style="list-style-type: none"> <li>1. Promote and enhance public access to waters held in public trust.</li> <li>2. Protect rights of navigation and space for water dependent uses.</li> <li>3. Protect public opportunity to enjoy physical and aesthetic shoreline qualities, including views.</li> <li>4. Regulate permitted uses to minimize interference with public use of water</li> </ol>	<ol style="list-style-type: none"> <li>1. The existing draft SMP includes public access goals and polices as an SMP element in Chapter 3 (3.030).</li> <li>2. The existing draft SMP also provides public access goals and policies in Chapter 8 (8.090 physical access and 8.140 visual access).</li> <li>3. There is no specific section on public access regulations in the existing SMP; however, public access regulations are included throughout the existing program. The draft</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
	<ol style="list-style-type: none"> <li>5. Local governments should plan for integrated public access system.</li> <li>6. Address public access on public lands.</li> <li>7. Require public shoreline development to include public access measures in developments unless incompatible, or alternate public access planning replaces site by site requirements.</li> <li>8. Provide public access standards for water enjoyment, water related, and non-water dependent uses and subdivision into more than four parcels unless addressed by a public access planning process, or there are incompatibility issues. Consider alternate methods such as off-site improvements, viewing platforms, separation of uses, and restriction of hours.</li> <li>9. Minimize impacts to existing views from public property or substantial numbers of residences. Give priority to water dependent uses where there is conflict.</li> <li>10. Assure no net loss of ecological functions.</li> </ol>	<p>SMP calls for encouraging linkages with linear park and recreation systems.</p> <ol style="list-style-type: none"> <li>4. There are opportunities to incorporate the County’s existing plans for public access, trails, parks, and open space into policies and regulations for public use.</li> </ol>
<p>173-26-221(5): Vegetation Conservation</p>	<ol style="list-style-type: none"> <li>1. Include planning and regulatory provisions to address vegetation conservation and restoration.</li> <li>2. Use available scientific information to establish vegetation conservation regulations.</li> <li>3. Establish standards through setbacks, buffers, clearing and grading, incentives, environment designation standards, or other provisions.</li> <li>4. Pruning and management of noxious weeds should be allowed.</li> </ol>	<ol style="list-style-type: none"> <li>1. Vegetation conservation is addressed in Chapter 4 (4.060) and Chapter 8 (8.130) of the existing draft SMP.</li> <li>2. Vegetation conservation is also addressed in various other sections of the existing draft SMP including the provisions for clearing and grading, and for residential development.</li> <li>3. Specific mitigation requirements for lost vegetative cover are not addressed in the existing SMP. The draft SMP does encourage use of native species, and limitations on clearing on landslide and erosion hazard areas.</li> <li>4. The existing SMP does not have a policy requiring the use of “available scientific and technical information” in establishing vegetation conservation regulations.</li> <li>5. The existing SMP does not discuss vegetated setback or buffer requirements in its vegetation management regulations (8.130), although Table 8.020 provides general setback provisions.</li> </ol>

WAC Element	WAC Guidelines	Existing SMP
173-26-221(6): Water Quality, Stormwater, and Nonpoint Pollution	<ol style="list-style-type: none"> <li>1. Prevent impacts to water quality and storm water quality, or significant impacts to aesthetic qualities and recreational opportunities</li> <li>2. Ensure consistency with other water quality and quantity regulations.</li> </ol>	<ol style="list-style-type: none"> <li>1. Water quality is addressed in Chapter 4 (4.080) of the existing draft SMP. Section 4.050 generally addresses policies for protection of water quality in shorelines.</li> <li>2. Section 4.080 does not explicitly address “significant impacts to aesthetic qualities and recreational opportunities.”</li> <li>3. Section 4.080 generally directs the SMP to insure mutual consistency between SMP regulations and other federal, state, and local regulations that address water quality.</li> </ol>
173-26-231: Shoreline Modifications, Generally	<ol style="list-style-type: none"> <li>1. Allow structural shoreline modifications only where demonstrated to be necessary to support a primary use, legally existing use in danger of loss or damage, or for mitigation or enhancement.</li> <li>2. Limit number of modifications and reduce effects.</li> <li>3. Allow modifications appropriate to shoreline type and environmental conditions.</li> <li>4. Ensure no individual or cumulative loss of ecological functions.</li> <li>5. Base decisions on scientific information and comprehensive drift cell or reach analyses.</li> <li>6. Plan for enhancement of impaired ecological functions, and incorporate measures to protect functions and ecosystem processes.</li> <li>7. Employ mitigation sequencing.</li> </ol>	<ol style="list-style-type: none"> <li>1. The existing SMP has one goal to eliminate the need for shoreline modifications generally.</li> <li>2. Chapters 7 and 10 address shoreline modification activities and establish goals, policies and regulations. The provisions in 7.010 through 7.020 are in general consistent with the guidelines.</li> <li>3. Specific inconsistencies between the provisions of the guidelines and the existing draft SMP and provided below in 173-26-231(3)(a) through (g).</li> </ol>
173-26-231(3)(a): Shoreline Modifications, Shoreline Stabilization	<ol style="list-style-type: none"> <li>1. Locate new development, including subdivisions, to avoid need for shoreline stabilization where feasible. Provide setbacks for steep slopes and bluffs, and discourage impacts to down-current properties and shoreline areas.</li> <li>2. Prohibit new structural stabilization except when necessary as demonstrated by the provisions in WAC 173-26-231(3)(a)(iii)(b)(I through IV):               <ol style="list-style-type: none"> <li>i. When necessary to protect primary structures using a geotechnical analysis, and when there is no let loss of ecological functions.</li> </ol> </li> </ol>	<ol style="list-style-type: none"> <li>1. Shoreline modifications are addressed in the existing SMP in Chapters 7 (7.030) and 10 (10.030), which address bulkheads, seawalls, and revetments.</li> <li>2. The goals, policies, and regulations addressing bulkheads, seawalls, and revetments in the existing SMP are generally consistent with the provisions of the guidelines.</li> <li>3. The guidelines require that SMPs provide for setbacks for steep slopes and bluffs. The existing draft SMP addresses feeder bluffs, but does not address steep slopes.</li> </ol>

Use existing rights-of-way where possible.</li> <li>6. Discourage pipelines and cables, and facilities requiring periodic maintenance in tidelands except when no other feasible alternative. Assure facilities do not result in loss of ecological functions or other significant impacts.</li> </ol>	<ol style="list-style-type: none"> <li>2. The existing SMP does not provide policies prohibiting utility production and processing facilities, transmission facilities, and development of facilities that may require periodic maintenance which disrupts shoreline ecological functions.</li> <li>3. The existing SMP accessory utility regulations are generally consistent with the guidelines.</li> <li>4. Regulations governing primary utilities in the existing draft SMP do not discourage several utility facility types and uses in the shoreline including production and processing facilities, transmission facilities, and pipelines and cable on tidelands.</li> </ol>

## Consistency of the Shoreline Inventory and Analysis Report

Adolfson reviewed the *Jefferson County Shoreline Master Program Update: Shoreline Inventory and Analysis Report* for consistency with state requirements for the amendment of shoreline master programs (WAC 173-26, Part III). The report was authored by Neil Harrington of the Jefferson County Department of Community Development and was last revised October 25, 2005. Adolfson planners and biologists reviewed the report in the context of specific guidelines and requirements established in WAC 173-26-201, entitled “Comprehensive process to prepare or amend shoreline master programs.”

Issues for consideration and discussion are outlined below. Table 2 documents in more detail our review of the Shoreline Inventory and Analysis Report for each water body and/or marine shoreline segment discussed in the Report. The table identifies the elements that are addressed in the Report, highlights elements that are missing, and provides general recommendations to consider during development of the updated inventory and characterization.

Overall, the Inventory and Analysis Report reflects a significant amount of work by County staff. The Report includes much information that will be helpful in ensuring consistency with the WAC guidelines and in updating the County’s Shoreline Master Program.

### Shoreline Inventory and Analysis Report Organization

The current Report includes a basic introduction with a brief discussion of regulatory context and reach break rationale, and a minimal description of the methods used. The shoreline inventory follows. The inventory is organized by basin beginning in the southeast portion of the County and continuing counterclockwise through the southwest portion of the County. Lakes are included in each appropriate river basin but addressed separately in the inventory.

Inventory headings for marine shoreline segments generally include ecological background, shoreline alterations, restoration opportunities, public access, and preliminary reach breaks. Inventory headings for river and stream shoreline segments include anadromous fish use, anadromous fish habitat, restoration opportunities, and preliminary reach breaks.

A more complete introductory section would expand on the discussion of regulatory context and include a more comprehensive methods section as described below. Following this introduction, we suggest including a large part of the existing introduction in a new Landscape Analysis section, with a regional overview of landscape controls such as climate and topography and major shoreline features, and a discussion of data gaps.

To facilitate analysis of ecosystem functions and processes, we suggest organizing stream segments by Water Resource Inventory Area (WRIA). For each WRIA, condition of the watershed and an overview of processes and functions would be summarized in a table. Organizing the inventory in this manner would not change the overall order of the shoreline segments.

In addition, more closely following the inventory elements identified in WAC 173-26-201 could achieve a more consistent organization of individual marine and freshwater shoreline segments. In general, we envision each shoreline segment inventory could include a basin overview, followed by a section identifying preliminary shoreline reaches, which would then be discussed in detail. Lakes would be included within their respective basins. The physical environment and biological resources would be described for each shoreline segment. A discussion of land use and altered conditions would follow, which would include land use and zoning, transportation and utilities, shoreline modifications, and public access. Finally, we suggest inserting a section presenting an ecological functions and processes analysis for each shoreline segment, which would relate to potential restoration opportunities and contribute to the overall functions and processes analysis tables for each WRIA.

## **Mapping**

The current Shoreline Inventory and Analysis Report includes 20 maps on 8.5" x 11" sheets. One map shows the western portion of the County at a coarse scale (approximately 1:230,000). The eastern portion of the County is shown on 19 maps at varying scales (from approximately 1:63,360 to 1:47,500). The existing map series includes aerial photography, drift cells, reach break boundaries for marine reaches, and text boxes identifying areas of special interest (e.g., important feeder bluffs, marinas, public access sites). Generally, the mapping provides a good framework for understanding the location of regulated shorelines and the general land cover and development patterns across the landscape. The use of text boxes is informative, but not uniformly used (e.g., some shoreline parks and recreational areas are identified, but not all are shown).

Maps do not show the approximate extent of the shoreline jurisdiction as a horizontal plane; for example, floodways and associated wetlands are not included in the mapping of the shoreline jurisdiction. The mapping also does not specifically address inventory elements as distinct themes or map series (e.g., zoning and land use; designated critical areas). To avoid development of an unwieldy map folio, we suggest developing thematic maps at a scale that would allow all of the County's shorelines to be shown on two or three sheets. Additionally, a new map series would be developed to illustrate the landscape analysis at a Countywide scale. These maps would depict landforms and factors that control and influence ecosystem-wide processes across the landscape (e.g., topography, geology, soils, precipitation, land cover) as well as other important areas and altered areas.

## Inventory Elements

The Shoreline Inventory and Analysis Report was reviewed to determine which elements described in WAC 173-26-201(3)(c), entitled “Inventory shoreline conditions,” are addressed and whether or not there are opportunities to expand the existing discussion or include missing elements in the update. Each element is described below. The table in Table 2 addresses these elements in greater detail for each regulated water body and/or marine shoreline segment.

- *Shoreline and adjacent land use patterns; transportation and utility facilities; impervious surfaces; vegetation; shoreline modifications; water-oriented uses (173-26-201(3)(c)(i)).*

Generally, there are opportunities in the existing Shoreline Inventory and Analysis Report to more consistently discuss elements of the built environment and their effects on shoreline functions. There is, for example, no consolidated discussion of land use patterns and associated impervious surfaces. For some resources, land use and land cover are discussed at a watershed scale. For other resources, land ownership and uses are described at the reach scale. Transportation facilities are sporadically discussed, usually in the context of impairment to a specific resource. Vegetation, when discussed, is generally related to riparian condition, and shoreline modifications are discussed in detail for the marine shoreline only (bulkheads, docks and piers, etc.). Marinas and other water-dependent uses are generally identified for marine shorelines, and overall, there is much more detailed information for marine shorelines, providing an opportunity to expand on freshwater shorelines (rivers, streams, lakes, and non-estuarine wetlands).

- *Critical areas (including wetlands, aquifer recharge areas, fish and wildlife conservation areas, geologically hazardous areas, channel migration zones, and frequently flooded areas/floodplains) (173-26-201(3)(c)(ii) and (vii)).*

The Shoreline Inventory and Analysis Report describes some critical areas (e.g., estuarine wetlands associated with river/stream mouths; feeder bluffs that may be regulated as landslide hazard areas). There are, however, opportunities to provide a more comprehensive discussion and mapping to describe the location and function of critical areas across the landscape and adjacent to the shoreline.

- *Degraded areas and sites with potential for ecological restoration (173-26-201(3)(c)(iii)).*

The Shoreline Inventory and Analysis Report generally discusses restoration opportunities in the context of site-specific structural fixes in the shoreline jurisdiction. There are opportunities to provide a more comprehensive discussion of restoration objectives or priorities, as well as a discussion of opportunities outside the shoreline jurisdiction.

- *Areas of special interest, such as priority habitats, developing or redeveloping harbors and waterfronts, previously identified toxic or hazardous material clean-up sites, dredged material disposal sites, or eroding shorelines (173-26-201(3)(c)(iv).*

The Shoreline Inventory and Analysis Report identifies some of these elements for different water bodies or segments of the marine shoreline. There is generally more detail focused on habitat and habitat conditions for the marine environment, and there are opportunities to add a more specific and comprehensive discussion of federally or state listed species or protected habitats. The Report includes occasional discussion of waterfront areas that are experiencing development pressure. Hazardous materials/contaminated sites and dredge disposal sites are not discussed. Eroding shorelines are referenced in the context of marine feeder bluffs, but not riverine channel migration zones.

- *Conditions and regulations in shoreland and adjacent areas (173-26-201(3)(c)(v).*

Zoning designations are described occasionally at a watershed or basin scale. There are opportunities to identify and discuss in more detail comprehensive land use, zoning designations, existing shoreline environment designations, and other land use regulations to identify potential conflicts between the condition of shoreline resources and potential development. Surface water management regulations should be considered, specifically in urbanizing or designated urban growth areas to identify applicable detention and water quality treatment requirements for new development and potential impacts on or benefits to shoreline resources.

- *Existing and potential shoreline public access sites, including public rights of way and utility corridors (173-26-201(3)(c)(vi).*

Generally, public access locations are identified consistently throughout the Report but are not consistently mapped. The Report also identifies the type of recreational uses in some places but not others (e.g., shellfishing, boating, camping), and the potential for new or expanded public access is not addressed. Information from the County's applicable long-range plans for parks and open space could be more effectively integrated as it relates to shorelines.

- *Rapidly developing shorelines, cumulative impacts from historic development (clearing and grading, bulkhead construction, intrusive development on priority habitats), and conversion of shorelines to nonwater-oriented uses (173-26-201(3)(c)(ix).*

The Shoreline Inventory and Analysis Report includes a general introduction section that provides a regional context, but there is no discussion of historic development patterns and use activities that have altered the landscape. This discussion could be included as part of the ecosystem-wide processes discussion. For the marine environment, the Report provides a fair amount of detail on the extent of bulkheads and other shoreline modifications and their general effects on habitats, but it does not specifically identify locations where development of non-water-oriented uses has occurred.

- *If archaeological or historic resources have been identified in shoreline jurisdiction, consult with the state historic preservation office and local affected Indian tribes regarding existing archaeological and historical information. (173-26-201(3)(c)(x).*

The Shoreline Inventory and Analysis Report does not identify or address the location or extent of cultural resources. Shoreline areas (riverine and marine) are generally high probability areas for archaeological resources. We suggest integrating any available Countywide inventories of historic and/or archaeological resources into the Report.

- *Gaps in existing information. During the initial inventory, local governments should identify what additional information may be necessary for more effective shoreline management. (173-26-201(3)(c)(viii).*

The Report occasionally notes the lack of data or research for a given location or topic area. We recommend developing a separate “data gaps” chapter to specifically address information that is not readily available but would more effectively aid the development and implementation of the County’s Shoreline Master Program.

### **Characterization of Functions and Ecosystem-wide Processes**

The existing Report was reviewed to determine which elements described in WAC 173-26-201(3)(d)(i) entitled, “Characterization of functions and ecosystem-wide processes,” are addressed and whether or not there are opportunities to expand discussion or include missing elements in the update. Each element is described below.

- *Hydrologic: Transport and storage of water; storing, transporting and stabilizing sediment across the natural range of flow variability; attenuating flow, wave and tidal energy; developing pools, riffles, gravel bars; removing excessive nutrients and toxic compounds; recruitment and transport of large woody debris and other organic material.*

The Shoreline Inventory and Analysis Report occasionally notes where floodplains have been cut off due to shoreline armoring and, blocking culverts and roads, although it generally relates the function of floodplains to salmonid habitat. Restrictions to tidal exchange in the marine environment from docks and road crossings are also occasionally noted but are not consistently related to habitat functions. Dams and water diversions are introduced, but their effects on shoreline functions and processes are not analyzed on either a shoreline segment or ecosystem-wide scale.

- *Shoreline Vegetation: maintaining temperature; removing excessive nutrients and toxic compounds, sediment removal and stabilization; attenuation of flow and wave energy; and provision of large woody debris and other organic matter.*

Generally, the Report does not address this element except for the occasional reference to the shoreline vegetation functions of bluff stabilization and providing large woody debris to rivers and streams. A connection was not usually drawn between riparian condition and streams and rivers listed on the 303(d) list for water temperature, excessive nutrients, or poor fish habitat. There are also opportunities to address the function of vegetation in shorelines in providing shading for spawning forage fish.

- *Hyporheic functions: removing excessive nutrients and toxic compound, storing water and maintaining base flows, support of vegetation, and sediment storage.*

The Report does not identify or address shoreline conditions in relation to hyporheic functions.

- *Habitat for native aquatic and shoreline-dependent birds, invertebrates, mammals; amphibians; and anadromous and resident native fish: Habitat functions may include but are not limited to; space or conditions for reproduction; resting, hiding and migration; and food production and delivery.*

This element was commonly mentioned in relation to salmonids, but infrequently for birds, invertebrates, mammals, or amphibians. The Report does not include a comprehensive discussion of habitat functions or processes at an ecosystem scale.

### **Methods and Approach for Landscape-scale Assessment**

We suggest that the landscape-scale assessment of the marine shoreline consider a variety of factors that influence shoreline conditions in Jefferson County, including:

- *Process controls such as surficial geology, landforms, topography, and bathymetry;*
- *Oceanographic processes;*
- *Nearshore processes including net shore-drift patterns and fluvial influences;*
- *Circulation, nutrient dynamics, sediment transport and heat/light transport across the landscape;*
- *Coastal bluff landslides; and*
- *Land use.*

We suggest basing the landscape characterization approach for non-marine shorelines (including estuaries and freshwater rivers, streams and lakes) in part on the landscape analysis guidance developed by Stephen Stanley, Susan Grigsby, and Jenny Brown of the Ecology's Shorelands and Environmental Assistance Program (Ecology publication #05-06-027). The landscape characterization approach attempts to answer four questions:

- *What are the key landscape processes that maintain aquatic/shoreline resources and their functions?*
- *Which geographic areas within Jefferson County are most important for maintaining each key process?*
- *How have human activities/land use altered important process areas and to what extent have the key processes been impaired?*
- *Which areas have potential for sustaining or improving resource function through protection and/or restoration?*

We suggest that the approach to characterizing landscape-scale processes consist of several steps, which are described below:

Step 1: Identify Aquatic Resources and their Contributing Areas;

Step 2: Identify Key Landscape Processes;

Step 3: Identify Process-Intensive Areas;

Step 4: Identify Process Alterations;

Step 5: Identify Responses to Process Alterations; and

Step 6: Synthesize Information to Identify Restoration and Conservation Opportunities.

<i>Bogachiel River</i>	√	√	<ol style="list-style-type: none"> <li>1. Describes salmonid use</li> <li>2. Erosion, sedimentation &amp; water quality addressed</li> <li>3. Partial description of LWD and riparian condition</li> </ol>	<ol style="list-style-type: none"> <li>1. Incomplete description of watershed, reach characteristics, and limits of jurisdiction</li> <li>2. No description of use by other fish &amp; wildlife species, archaeological/historical resources; restoration opportunities; public</li> </ol>	<ol style="list-style-type: none"> <li>1. Clarify rationale for reach breaks</li> <li>2. Could expand on issue of erosion and channel migration</li> <li>3. Provide context for regulations (e.g., 4 miles of river in Jeff. Co.; what percentage of the river is this?)</li> </ol>

SMP Resource	WAC <sup>2</sup>	INV <sup>3</sup>	Inventory Elements <sup>4</sup>		Additional Comments and Revision Opportunities
			Elements Addressed in Current Inventory	Gaps and Opportunities	
				access 3. Limited description of data gaps 4. Does not address built environment or regulations (zoning, shoreline modifications, infrastructure & utilities, transportation, impervious area, Shoreline Environment Designation, hazardous waste, or new public access opportunities) 5. Implies that channel migration is an issue but does not specifically address 6. No specific discussion or mapping of regulated critical areas	4. What drives conditions upstream? 5. Expand on water quality issues – what is source of low do and high temp? 6. Define Habitat Limiting Factors Analysis and explain classification of “poor” and “fair” 7. We suggest a general summary statement of overall condition of shoreline ecological functions (impaired, intact, etc.) and relationship to ecosystem processes
